without the attitude

exceptional lab water systems without the attitude

H₂O. It's such a simple compound.

So why settle for a complicated lab water system? Thermo Scientific Barnstead water purification systems deliver pure and ultrapure water – with ease. With flexible systems designed precisely for your applications, and multiple water types from a single solution. Plus simple, efficient operation without the need for maintenance plans, and innovations like UV intensity monitoring to ensure accurate total organic carbon (TOC) readings. It's no surprise that the smart choice in cost-effective lab water systems is the familiar name you already trust.

lab water experts

For more than 130 years, Thermo Scientific lab water systems have been a trusted resource for science and industry. Our complete line of water purification technologies includes solutions for your most critical and everyday application needs, from electrodeionization to reverse osmosis and distillation.

Thermo Scientific Barnstead lab water systems deliver:

innovation

Our water purification portfolio features advanced ergonomics and technology, including remote dispensing and UV intensity monitoring – that offer users full control with confidence.

flexibility

Laboratory environments often have limited bench space. Our portfolio offers numerous mounting options, small footprints and flexible dispensing options to provide you the luxury of designing a configuration that best suits your lab. Many water systems can be easily upgraded to allow for additional capacity.

convenience

Our Thermo Scientific H₂0 Select™ analysis program and complete all-in-one box ordering gives you the confidence to select the right solution. Receive a complete water system using one part number and have the components you need to easily maintain your new water purification system.

innovation

that deliver accuracy

With innovative water monitoring technology, Thermo Scientific water purification systems eliminate expense and lost time which may occur with contaminated lab water.

Advanced feed water monitoring

Alerts the user to fluctuations in the feed water quality. Poor feed water will reduce cartridge life.

TOC measurements with UV intensity monitoring

Continuously monitoring and recording TOC measurements in real-time, this technology ensures ultrapure water that meets or exceeds even the most stringent requirements for sensitive applications. A photo sensor continually checks the intensity of the UV lamp. A drop in measured UV radiation can result in an incorrect TOC measurement.

EDI systems feature tank recirculation to maintain high purity water even during long periods of inactivity

Automatic recirculation of the water in the tank across a special polisher actively protects against bacteria growth even during long periods of inactivity.

flexibility

system design

Mounting flexibility

Installation options include under the cabinet, on the wall, on the bench, or free-standing units with wheels for added mobility.

Full system control at the Thermo Scientific xCAD remote dispenser

Eliminate the hassle of going back to the primary system to adjust parameters.

Upgradeable units

Growing the lab or planning for changing needs? Many of our systems can be upgraded to accommodate greater capacity.

Dual water quality

Need more than one type of water? Many of the systems produce two types of water from just one system.

convenience

with customized system selection

Based on the results of a Thermo Scientific H_2O Select analysis, we will recommend the best water system for your application based on your feed water quality, laboratory applications, daily volume requirements and budget. We do all the thinking for you.

How it works:

- 1. Contact your local sales representative for a complimentary H₂O Select analysis kit.
- **2.** Fill the sample bottle with your anticipated feed water.
- **3.** Answer the short questionnaire pertaining to your water requirements, applications and budget.
- **4.** Place the completed application and water sample bottle in the return box. Add postage and mail to the Thermo Scientific Barnstead Water Lab (return label included in box).

All-in-one-box ordering

Have confidence in knowing that there are no surprises with added post sale costs. Everything you need ships under one part number!

Easy self maintenance

The Aquastop quick connections make changing your cartridges quick and simple.

Common Water Impurities

Don't let impurities contaminate your sensitive experiments. Thermo Scientific Barnstead water purification systems are engineered to remove impurities that threaten your research so you can focus on what's important — your next discovery.

Sand, silt, clay and other suspended particles cause water to be turbid. These suspended particles can interfere with instrument operation, plug valves and other narrow flow paths, and foul reverse osmosis membranes. They typically range from 1 - 10 μm in size.

Colloids

Colloidal particles typically have a slightly net negative charge, range in size from $0.01-1.0~\mu m$, and can be either organic or inorganic. Unlike suspended particles, colloids do not settle out by gravity, but remain suspended in the liquid that carries them. Colloids clog filters, interfere with instrument operation, foul reverse osmosis membranes and can bypass ion exchange resins, resulting in lower resistivity in deionized water systems.

Inorganic Ions

Impurities such as silicates, chlorides, fluorides, bicarbonates, sulfates, phosphates, nitrates and ferrous compounds are present as cations (positively charge ions) and anions (negatively charged ions). Water with a high concentration of ions will conduct electricity readily and have high conductivity and low resistivity, as conductivity and resistivity are inversely related. lons will adversely affect the results of inorganic analyses such as IC, AA, ICP/MS and may retard cell and tissue growth in biological research. They can also affect the cartridge life in deionized water systems.

Dissolved Organics

Organic solids are present from plant and animal decay and from human activity. They may include proteins, alcohols, chloramines and residues of pesticides, herbicides and detergents. They foul ion exchange resins, interfere with organic analyses including HPLC, gas chromatography and fluoroscopy. They will also hinder electrophoresis, tissue and cell culture.

Dissolved Gases

Water naturally contains dissolved gases such as carbon dioxide, nitrogen and oxygen. Carbon dioxide dissolves in water to form weakly acidic carbonic acid (H₂CO₃), which can alter the pH of the water. Additionally, oxygen, the most common non-ionized gas, may cause corrosion of metal surfaces.

Microorganisms

Bacteria, fungi and algae are found in all natural water sources. Chlorination eliminates harmful bacteria, but tap water still contains live microorganisms which interfere with sterile applications, such as cell and tissue culture.

Pyrogens and Viruses

Pyrogens or bacterial endotoxins are lipopolysaccharide molecules incorporated in the cell membrane of gram negative bacteria. Viruses are considered to be non-living nucleic acids. Both can adversely affect laboratory experiments often hindering cell and tissue growth in culture.

Nucleases

RNase and DNase are naturally occurring enzymes that are instrumental in regulating bodily functions. As important as these enzymes are to the life process, they can be devastating to nucleic acid experiments. If these contaminants are present in the lab water used, the ability to amplify DNA molecules will be severely limited. Likewise, experiments utilizing RNA can be ruined.

Thermo Scientific Barnstead Water Purification Technologies

To make pure and ultrapure water, the impurities discussed on the previous page must be efficiently and effectively removed. Barnstead water purification systems employ multiple technologies, some synergistically, to remove impurities and give you consistently PURE water.

Water purification is a step-by-step process often requiring a combination of technologies, each of which varies in the ability to remove specific contaminants.

The table below illustrates which impurities are removed by each technology.

	Distillation	Reverse Osmosis	Deioization	Electro- deionization	Filtration	Ultrafiltration (UF)	Adsorption	Ultraviolet (UV) Oxidation	Combination UV/UF
Inorganic ions					۵	۵	۵	۵	۵
Dissolved gasses		۵			۵	۵		6	\(\)
Organics			۵	\(\)	۵	۵			
Particles			۵	۵			۵	۵	
Bacteria			۵	۵			۵		
Pyrogens			۵	۵	۵			۵	
Nucleases	۵	۵	۵	\(\)	۵			۵	

A basic distillation diagram.

Distillation

Distillation has the broadest removal capabilities of any single form of water purification.

Water is boiled and undergoes phase changes during the distillation process, changing from liquid to vapor and back to liquid. It is the change from liquid to vapor that separates the water (in various degrees) from many dissolved impurities, such as ions, organic contaminants with low boiling points $<100^{\circ}\text{C}$, bacteria, pyrogens and particulates. Distillation can not be used on its own to remove inorganic ions, ionized gases, organics with boiling points higher than 100°C , or dissolved non-ionized gases.

Benefits

- Offers the broadest removal capabilities of any single form of water purification
- Requires no consumables

Limitations

- Requires periodic maintenance and manual cleaning of system to maintain water purity
- · Requires water for cooling

Systems that utilize this technology

 Thermo Scientific Barnstead Classic Stills and Mega-Pure Stills

Thermo Scientific Barnstead Water Purification Technologies

Filtration

Barnstead water purification products offer both depth (nominal) and membrane (absolute) filters.

Depth filters are most commonly used as a pretreatment and are manufactured by winding fibers around hollow and slotted tubes. As water passes through the wound fiber matrix toward the center tube particles are retained on the fibers. Traditionally this type of filter removes most of the impurities above the rated pore size of the filter. Most often these filters are rated to remove larger particles (> 1 μ m) to protect the technologies that follow.

Membrane filters are often termed absolute, meaning that they are designed to remove all particles above the rated pore size of the filter. These filters use a membrane, (in flat sheet or hollow fiber form), and are most often used at the end of a system to remove bacteria or other particles that are not removed by the preceding technologies. Traditionally membrane filters in laboratory water systems have a rated pore size below 0.45 µm, most often 0.2 µm.

Benefits

- Efficient operation
- · Maintenance is change out only

Limitations

- Clogging
- Will not remove organics, nucleases, pyrogens, dissolved gases or dissolved inorganics

Systems that utilize this technology

 Thermo Scientific Barnstead GenPure, MicroPure, E-Pure, LabTower EDI, Smart2Pure, Pacific TII, LabTower TII water purification systems

Ultrafiltration (UF)

In water purification, ultrafiltration is used to remove pyrogens (bacterial endotoxins) and nucleases, which is critical for tissue culture, cell culture and media preparation.

Ultrafilters use size exclusion to remove particles and macromolecules. By design, ultrafilters operate similar to reverse osmosis membranes; particles are captured on the surface of the membranes and are flushed from the membrane via a reject stream. Ultrafilters are used at the end of systems ensuring the near total removal of macromolecular impurities like pyrogens, nucleases and particulates.

Benefits

- Effectively removes molecules (pyrogens, nucleases, microorganisms, particulates) above their rated size
- · Long life
- · Helps to remove pyrogens and nucleases

Limitations

 Will not remove dissolved inorganics, dissolved gases, and organics

Systems that utilize this technology

 Barnstead GenPure, MicroPure, and Smart2Pure water purification systems

Reverse Osmosis

Reverse osmosis is the most economical method of removing up to 99% of feed water contaminants.

To understand reverse osmosis you must first understand osmosis. During natural osmosis, water flows from a less concentrated solution through a semipermeable membrane to a more concentrated solution until concentration and pressure on both sides of the membrane are equal.

In water purification systems, external pressure is applied to the more concentrated (feed water) side of the membrane to reverse the natural osmotic flow. This forces the feed water through the semipermeable membrane. The impurities are deposited on the membrane surface and sent to drain and the water that passes through the membrane as product water is, for the most part, free of impurities.

A reverse osmosis membrane has a thin microporous surface that rejects impurities, but allows water to pass through. The membrane rejects bacteria, pyrogens and 90-95% of inorganic solids. Polyvalent ions are rejected easier than monovalent ions. Organic solids with a molecular weight greater than 200 Daltons are rejected by the membrane but dissolved gases are not as effectively removed.

Reverse osmosis is a percent rejection technology. The purity of the product water depends on the purity of the feed water. The product is typically 95-99% higher in purity than that of the feed water.

Due to the restrictive nature of the membrane, the flow rate is much slower than other purification technologies. This slow flow rate means that all RO systems require a storage reservoir to provide a constant supply of RO water ready when you need it.

Benefits

- To varying degrees, removes most types of contaminants, bacteria, pyrogens and 90-95% of inorganic ions
- · Requires minimal maintenance

Limitations

- Limited flow rates through the membrane require intermediate storage devices to meet user demand
- · Does not remove dissolved gases
- · Requires pretreatment to avoid damaging the membrane
 - > Oxidation Chlorine
 - > Scaling CaCO₃
 - > Fouling Organics and Colloids
 - > Piercing Hard particles

Systems that utilize this technology

 Thermo Scientific Barnstead Smart2Pure, LabTower EDI, Pacific TII, LabTower TII, Pacific RO, LabTower RO water purification systems

Process of reverse osmosis

Thermo Scientific Barnstead Water Purification Technologies

Deionization

Deionization is also referred to as demineralization or ion exchange.

The process removes ions from feed water with the use of synthetic resins. These resins are chemically altered to have an affinity for dissolved inorganic ions and are divided into two classifications: cation removal resins and anion removal resins.

Cations have a positive charge and include sodium (Na*), calcium (Ca*²) and magnesium (Mg*²). Anions have a negative charge and include chloride (Cl⁻), sulfates (SO $_4$ -²), and bicarbonates (HCO-³). The ions are removed from the water through a series of chemical reactions. These reactions take place as the water passes through the ion exchange resin beds. Cation resin contains hydrogen (H*) ions on the surface which are exchanged for positively charged ions. Anion resin contains hydroxide (OH¹) ions on its exchange sites which are exchanged for negatively charged ions. The final product of these two exchanges is H* and OH⁻, which combine to form water (H₂O).

Deionization is the only technology which produces the resistivity requirement for Type 1 reagent grade water. In laboratory water systems, cation and anion resins are most often mixed together allowing them to achieve maximum ionic purity.

Two-bed deionization – The cation and anion resin are in separate halves of a cartridge. In general, this method is less effective deionizing water as compared to the mixed-bed deionization; however, it is more tolerant of other types of impurities.

Mixed-bed deionization – We use semi-conductor grade mixed bed deionization resin to achieve maximum resistivity and low TOC. Mixing the cation and anion resin drives the deionization to completion, making it more efficient and more effective at the removal of ions.

Benefits

- Removes dissolved inorganics ions very effectively
- $\bullet\,$ Produces product water with a resistivity above 18 M $\!\Omega.cm$

Limitations

- Finite capacity once all ion binding sites are occupied, ions are no longer retained and the cartridge must be replaced
- · Does not remove organics, particles, pyrogens or bacteria

Systems that utilize this technology

 Thermo Scientific Barnstead GenPure, MicroPure, E-Pure, LabTower EDI, Smart2Pure, Pacific TII, LabTower TII, and the Bantam water purification systems, Hose Nipple, and B-Pure cartridges

Diagram showing how cations and anions are exchanged on the resin.

Two bed resin is shown on the left and mixed bed resin in on the right.

Process of electrodeionization

Electrodeionization (EDI)

In contrast to conventional ion exchange in which resins are exhausted and must either be thrown away or chemically regenerated, EDI utilizes an electric current for continual resin regeneration.

How EDI works

Several layers of ion selective membranes are positioned between an anode and a cathode. Layered ion exchange resin beds and concentrate chambers are alternately positioned between them.

On applying an electric voltage, water $({\rm H_2O})$ is split into H+ and OH- in the cell. The H+ and Na+ cations can migrate through the cation permeable membranes, anions through the anion permeable membranes.

The ions migrate in the direction of the applied voltage, i.e. anions to the positive pole (anode), cations to the negative pole (cathode). The water ions H+ and OH– that migrate through an ion exchange chamber displace salt ions retained by the ion exchanger resins and so continually regenerate the resins. The salt ions migrate through the appropriate ion selective membranes into the concentrate chambers and are flushed out of them by water. As all concentration chambers are flushed through one after the other, excess H+ and OH– ions can again combine to form H₂O.

Benefits

- · Effectively removes ions
- · Continuously regenerates automatically

Limitations

- Limited capacity feed water must be of high quality
- Does not remove organics, particles, pyrogens or bacteria

Systems that utilize this technology

• Barnstead LabTower EDI water purification system

Thermo Scientific Barnstead Water Purification Technologies

Adsorption

Adsorption uses high surface area activated carbon to remove organics and chlorine from feed water.

It is used as a first or second step in most water purification systems and may be used as a final step, in combination with ion exchange resins, to achieve ultra low Total Organic Carbon (TOC). Organics and chlorine adhere to the surface of the activated carbon and remain attached to the carbon.

Mixed-bed deionization and adsorption – We use a combination semiconductor grade mixed-bed deionization resins and synthetic carbon in a single cartridge to achieve maximum resistivity and low Total Organic Carbon (TOC).

Benefits

- · Removes dissolved organics and chlorine
- · Long life

Limitations

· Will not remove ions and particulates

Systems that utilize this technology

 Barnstead GenPure, MicroPure, E-Pure, LabTower EDI, Smart2Pure, Pacific TII, LabTower TII, and the Bantam water purification systems, Hose Nipple, and B-Pure cartridges

Selection of high quality resins used in our cartridges.

feed water with organic and chlorine contaminants come into contact with the activated carbon in the cartridge.

The impurities adhere to the surface of the carbon, allowing purified water to be produced.

Ultraviolet (UV) Oxidation

Photochemical oxidation with ultraviolet light eliminates trace organics and inactivates microorganisms in feed water.

The UV lamps in our lab water systems generate light at two wavelengths, 185 and 254 nm. The light generated at 254 nm has the greatest anti-bacterial action, reacting with their DNA, resulting in inactivation. The combination 185/254 nm light oxidizes organic compounds, allowing for total oxidizable carbon levels of less than 5 ppb.

Benefits

- Effective method to prevent bacterial contamination
- Oxidizes organics to produce pure water with low TOC levels

Limitations

· Will not remove ions, colloids and particulates

Systems that utilize this technology

 Barnstead GenPure, MicroPure, LabTower EDI, Smart2Pure, Pacific TII, LabTower TII water purification systems

Combination Ultraviolet Oxidation and Ultrafiltration (UV/UF)

The use of ultraviolet oxidation and ultrafiltration technologies in conjunction with adsorption and deionization in the same system produces water virtually free of all impurities. These technologies have demonstrated the ability to remove nucleases such as RNase and DNase as well as pyrogens when challenged with known concentrations of the material. The Type 1 systems with UV/UF options produce reagent grade water with resistivity up to 18.2 $M\Omega.cm$, TOC of 1-5 ppb, pyrogens <0.001 EU/mL and no detectable RNase, DNase or DNA.

Benefits

- Removes nucleases and DNA
- Produces water with low TOC and pyrogen levels

Limitations

· Must be used in the same system

Systems that utilize this technology

 Barnstead GenPure, MicroPure, and Smart2Pure water purification systems

International Water Standards

What does Type 1 water mean?

Reagent water has quantitative specifications that describe the level of purity for the water. These specifications have been described by ASTM (American Society for Testing and Materials) D1193, ISO (International Organization for Standardization) 3696 and CLSI®-CLRW. (Clinical and Laboratory Standards Institute-Clinical Laboratory Reagent Water). The most commonly used standards, ASTM D1193-6, are summarized in the tables below.

ASTM Standards for Reagent Water							
Measurement (unit)	Type I	Type II	Type III				
Resistivity (MΩ.cm) at 25°C	>18	> 1	> 4				
Total organic carbon (ppb)	< 50	< 50	< 200				
Sodium (ppb)	< 1	< 5	< 10				
Chloride (ppb)	< 1	< 5	< 10				
Total silica (ppb)	< 3	< 3	< 500				

The ASTM standards are further subdivided into A, B and C. These standards can be used in conjunction with the Type of water.

ASTM Standards for Reagent Water								
Measurement (unit)	Α	В	С					
Heterotrophic bacteria count (CFU/mL)	10/1000	10/100	1000/10					
Endotoxin (units per mL)	0.03	0.25	n/a					

Here are some additional definitions of the parameters they use to indicate the water's purity.

Resistivity – the tendency of water without ions to resist conducting electricity.

The unit of measure is megohm-centimeter ($M\Omega$.cm), often shortened to $M\Omega$ or "meg". It is generally used for high purity water. The theoretical maximum is 18.2 $M\Omega$.cm at 25°C . The higher the ionic content – the lower the resistivity and the lower the ionic content – the higher the resistivity (high resistivity is good!). In ultrapure water systems this value is determined using an in-line meter. Conductivity and resistivity measurements are inversely related to each other.

Conductivity – the tendency of water that contains ions to conduct electricity.

The unit of measure is microsiemens/centimeter (μ S/cm) or microhm/cm. The measurement is used to measure feed water or lower quality treated water. The more ions present in the water, the higher the conductivity. This is measured by a conductivity meter.

Total Organic Carbon (TOC) – a measure of the organic contaminants found in water.

The unit of measure is parts per million (ppm) or parts per billion (ppb). Feed water can be in the 2-5 ppm range and the best high purity water should be in the 1-5 ppb range. Measurement of TOC is done using an in-line system.

Advanced Technology Used to Monitor Purity

Conductivity and Resistivity

Electrical conductance or resistance is measured by two in-line electrodes. Electrical current moves through water using ionic molecules as stepping stones. The fewer stepping stones, the more difficult the passage of electricity. This causes less electrical conductance and more electrical resistance. The temperature of the water also affects the conductivity/resistivity so readings are usually normalized to 25°C via temperature compensation.

We use resistivity to measure ion concentration in pure water. We understand water and realize that in order to achieve Type 1 water, meeting the most stringent requirements of our customers, multiple technologies must be used.

Building Your Water System

What Type of Water Do You Need?

When designing your water system, we suggest you take time to evaluate the applications and interest areas of the lab now and in the future. Take a look at the table below to determine what type(s) of water you need.

Building Your Water System

Barnstead GenPure water purification system

What Thermo Scientific Barnstead water systems provide

Our water systems are engineered to be used independently or in conjunction with our other water systems for more flexibility. Below is a summary of our product lines for each water type.

Barnstead Smart2Pure water purification system

Ultrapure (Type 1) Water

This grade of water is required for your most sensitive and critical laboratory applications. Type 1 water can be made pyrogen-, nuclease-, bacteria- and particulate-free. It has the highest purity, but is also the most expensive to generate.

If your applications require different types of water, let our experts assist with designing a water purification system specific to your needs.

The below systems provide you with the Type 1 water you need for your applications.

- Thermo Scientific Barnstead LabTower EDI water purification system
- Thermo Scientific Barnstead Smart2Pure water purification system
- Thermo Scientific Barnstead GenPure water purification system
- Thermo Scientific Barnstead MicroPure water purification system
- Thermo Scientific Barnstead E-Pure water purification system

The ultrapure systems differ in their features and daily volume output, so please see the Type 1 Section for complete information.

Pure (Type 2) Water

Type 2 water is most widely used in general laboratory applications, such as reagent preparation and glassware rinsing. It is also commonly used to feed our Type 1 systems to create a comprehensive water system.

The below systems provide you with the Type 2 water you need for your applications.

- Thermo Scientific Barnstead Pacific TII water purification system
- Thermo Scientific Barnstead LabTower TII water purification system
- Thermo Scientific Barnstead Mega-Pure Glass Stills water purification system
- Thermo Scientific Barnstead Classic Stills water purification system

Barnstead GenPure xCAD Plus water purification system, shown with two additional remote dispensers

Reverse Osmosis (RO) Water

RO is a percent removal technology, thus the purity of the product water is directly dependent on the quality of the feed water. Accordingly, it can not be generally classified as a specific "type" of water.

RO water is recommended for use in general laboratory equipment such as the sterilizer, dishwasher and water baths.

The below systems provide you with the RO water you need for your applications.

- Thermo Scientific Barnstead Pacific RO water systems
- Thermo Scientific Barnstead LabTower RO water systems

Cartridge and Filter Systems

Cartridges are a great option for laboratories either needing point of use polishing of pretreated water or single state treatment of tap water.

The below cartridge and filter systems are available for your specific application needs.

- Thermo Scientific Barnstead B-Pure water system
- Thermo Scientific Barnstead Hose nipple cartridges
- Thermo Scientific Barnstead Bantam deionizer
- Thermo Scientific Barnstead 1/2 Size B-Pure filters

Barnstead Hose Nipple Cartridge and Holder

Barnstead B-Pure Cartridge Holder

Barnstead Bantam Deionizer

Building Your Water System

Applications in the Lab: Cell and Tissue Culture, PCR, Media Prep and HPLC

Water Type(s) Needed: Type 1 (low organics, pyrogens and nucleases) and Type 2 water

Solution: Barnstead Pacific TII, 30 L reservoir, and Barnstead GenPure xCAD Plus UV/UF

The Watson Lab is a traditional cell and molecular biology lab, so they needed a system that is capable of producing Type 1 water free of nucleases, pyrogens and bacteria. Our Barnstead GenPure xCAD Plus UV/UF system is perfect for their ultrapure water needs.

Our Barnstead Pacific TII, which will produce water for the general lab uses, will also serve as feed water for the GenPure xCAD Plus UV/UF.

Applications in the Lab: ICP/MS, GC/MS, HPLC, Chemical and Buffer Prep Water Type(s) Needed: Type 1 (with low organics) and Type 2 water

Solution: Barnstead LabTower TII and the Barnstead GenPure Pro UV

The Le Lab performs analytical experiments on a daily basis. They would like to make their own buffers and reagents, so we suggested a configuration that would give the lab both Type 1 and Type 2 water.

Our Barnstead LabTower TII converts tap water into Type 2 water, which is stored in the 100 L integrated reservoir. Water can be drawn from the reservoir or from our Barnstead GenPure Pro UV (which has a 0.2 µm on it to ensure bacteria-free water). The reservoir feeds our Barnstead GenPure Pro system, which will deliver ultrapure (Type 1) water.

Mix and Match for Greater Flexibility

Our water systems are designed to mix and match, as many laboratories have the need for multiple types of water. Here are some examples of our systems built for use in labs with diverse interest areas.

Applications in the Lab: General lab use, rinsing of glass and plastic ware, media prep, HPLC

Water Type(s) Needed: Type 1 and Type 2 (distilled)

Solution: Barnstead Mega-Pure Still with Automatic Collection System and a Barnstead MicroPure UV

The Bauer Lab needed Type 1 water for their HPLC and analytical experiments (estimated to be less than 15 L a day) and distilled water for general reagent preparation and glassware rinsing, thus our Barnstead MicroPure UV and a Barnstead Mega-Pure Still with Automatic Collection System were recommended. A dual cartridge deionizer was also suggested as pretreatment to the still as the lab's tap water was especially hard.

Applications in the Lab: Protein purification and PCR

Water Type(s) Needed: Type 1

Solution: Barnstead Smart2Pure UV/UF

Biochemical techniques such as protein purification and PCR are important for the Simpson Lab, but they have serious space constraints. Our Barnstead Smart2Pure UV/UF is the all-in-one solution for tap to Type 1 water. It converts tap water to ultrapure water and has a small foot print. The UV/UF option will provide the lab with nuclease free water, perfect for their sensitive applications.

TYPE 1

ultrapure

water purification systems

What sets Thermo Scientific Barnstead water purification systems apart?

Our Barnstead water purification portfolio includes a complete line of Type 1 systems to meet all your ultrapure water needs. Why so many options? For you to have a tailored system specifically for your needs. No need to pay for technologies that you won't use!

convenience

Quick-change cartridge design simplifies self maintenance

flexibility

Full system control at the Thermo Scientific Barnstead GenPure xCAD Plus remote dispenser

Select the water system that best fits your requirements

Benefits

	•			
	Ultra-low organic levels, <5 ppb HPLC, TOC, GC/MS, ICP, ICP-MS	UV oxidation is necessary for the removal of organics in the feed water, reduces organic levels to >5 ppb, and protects against microorganisms		
Applications	Cell culture, monoclonal antibody production, electrophoresis	Ultrafiltration removes pyrogens from the feed water		
	Nuclease and pyrogen-free applications such as PCR, 2-D electrophoresis, cell culture, blotting	UV/UF is the most common combination of technologies – used to reduce organics and remove pyrogens and nucleases		
	UV monitoring	Photosensor continually checks the intensity of the UV lamp. A decrease could result in an incorrect TOC measurement result.		
Technology	Feed water monitoring	Feed water monitoring alerts you to fluctuations in feed water quality		
	Total Organic Carbon (TOC) monitor	Real-time monitor of the amount of organic materials in the product water shown on the display		
	Volumetric Dispensing	Dispense at the push of a button. Control from 0.01-65 liters with an accurancy of <0.5%		
Features	GenPure xCAD Plus remote dispenser	Allows for full control of the system at the GenPure xCAD Plus remote dispenser		
i cataros	Under-the-bench mounting	Ideal when bench space is tight. System sits under the bench and out of sight.		
	RS-232 data printing at pre-programmed intervals	Satisfies GLP guidelines, data available in print		
Capacity	Optimal amount of water to use daily to sustain reasonable cartridge life	Expands with your laboratory and application needs		

TAP WATER FEED REQUIRED

PRETREATED WATER FEED REQUIRED

^{*}Applicable when using pre-treated feed water only.

Thermo Scientific Barnstead GenPure xCAD Plus water purification system

The Barnstead GenPure xCAD Plus system delivers ultrapure 18.2 $M\Omega$.cm water with consistent quality for the most demanding and sensitive applications. The xCAD remote dispenser provides flexibility and control.

<u> APPLICATION INCLUDES:</u>

Molecular Biology and Microbiology

- · Cell and tissue culture
- · PCR, DNA sequencing
- Electrophoresis

Analytical Chemistry

- HPLC
- GC, GC-MS, ICP-MS, AA
- TOC Measurements, IC

All GenPure systems exceed international standards ASTM Type I, ISO 3696 Grade 1, ASTM D1193 and CLSI-CLRW.

Simultaneously dispense from up to three dispensers

- · Each system ships with a single xCAD Plus remote dispenser
- For increased flexibility, add one or two more xCAD Plus dispensers
- Dispense from all three simultaneously

Integrated feed water monitoring

Additional measuring cell monitors feed water conductivity. If the quality
of the feed water drops below the set value, a fault message will immediately
be displayed.

Online TOC measurement with UV intensity monitoring

- Real-time TOC monitoring for continual measurement of organic substances present in the water
- Continuous monitoring of UV intensity removes the risk of false TOC values due to diminished UV intensity
- Fault message alerts user when the UV lamp intensity is no longer sufficient for accurate TOC measurements

UV Photo-oxidation 185/254 nm

- High performance UV assembly reliably reduces the content of microorganisms and their metabolites
- UV oxidation also reduces organic compounds in the water to ultra-low levels

Leak detection

Internal leaks can be detected and an error displayed

Ready-to-use

 Feed water pressure switch, wall bracket, UV lamp, ultrapure cartridge, sterile filter, all included in one part number

Measurement of conductivity/resistivity

- Conductivity cells are carefully calibrated prior to each measurement via built-in reference resistance with cell constants at 0.01 cm⁻¹
- \bullet Temperature measurements are made by a platinum chip sensor with $\pm~0.1^{\circ}\text{C}$ accuracy

Quick-connect cartridge replacement

 Aquastop quick-connect capability enables cartridge replacement within seconds even mid-operation

Exact dosing

 Electronic dosing for fully automatic volume control of 0.01-65 L with < 2% accuracy

GLP-compliant documentation

- Real-time clock and code-protected operating system prevents unauthorized changes to system settings
- RS-232 interface with adjustable send-interval for safe data transfer of all measured data, faults, date and time to a PC computer or log printer
- Digital microprocessor control automatically monitors and stores faults from the last four weeks
- . USP-compliant conductivity measurement with temperature compensation can be switched on or off

Visible ultrapure water quality

Important measured values of conductivity/resistivity and TOC are easy to see during dispensing.

Non-Stop: System ready for dispensing

Thermo Scientific Barnstead GenPure xCAD Plus water purification system (continued)

Thermo Scientific xCAD Plus remote dispenser – full system control in a compact design

- xCAD is short for "Extended Control and Dispenser." The system provides more flexibility for ultrapure water dispensing with an action radius of 32 inches (80 cm)
- Ergonomic dispensing arm provides precise volume dosing at the press of a button
- Turned, height adjusted or extended towards your vessel, you'll appreciate the flexibility of this
 dispenser
- One-of-a-kind design provides access to all system controls at your fingertips
- Specify bench-top or wall-mount xCAD Plus dispenser for the installation option of your choice. The small footprint of the bench-top xCAD Plus allows for more bench space while the wall-mount version completely frees up horizontal workspace.
- · Adjustable controller makes handling more practical and provides a clear view of critical settings
- In addition to flexible xCAD Plus installation options, GenPure systems can also be installed under the bench or wall-mounted with included mounting brackets up to 2.5 m (8 ft) away from main system.

xCAD Dimensions	
	Dimensions W x D x H in (mm)

Thermo Scientific Barnstead GenPure Pro water purification system

The Barnstead GenPure Pro system delivers ultrapure 18.2 $M\Omega$.cm water with consistent quality. Suitable for the most demanding laboratory applications, this ultrapure water system will deliver water from a small footprint. The GenPure Pro system can be used on a laboratory bench or on a wall. The new flexible dispenser offers maximum freedom while dispensing ultrapure water up to 24 inches (60 cm) away from the unit.

APPLICATION INCLUDES:

Molecular Biology and Microbiology

- · Cell and tissue culture
- PCR, DNA sequencing
- Electrophoresis

Analytical Chemistry

- HPLC
- GC, GC-MS, ICP-MS, AA
- TOC Measurements, IC

All GenPure systems exceed international standards ASTM Type I, ISO 3696 Grade 1, ASTM D 1193 and CLSI.

Dispensing for a variety of tasks

 New flexible dispenser offers a radius of 24 inches (60 cm) from the system for filling larger vessels or glassware washing

Leak detection

• Internal leaks can be detected and an error displayed

Integrated feed water monitoring

 An additional measuring cell monitors feed water conductivity. Any exceeding of the limiting value is immediately displayed to maximize cartridge life.

Online TOC measurement with UV intensity monitoring

- Real-time TOC monitoring for continual measurement of organic substances present in the water
- Continuous monitoring of UV intensity removes the risk of false TOC values due to diminished UV intensity
- Fault message alerts user when the UV lamp intensity is no longer sufficient for accurate TOC measurements

UV Photo-oxidation 185/254 nm

- High performance UV assembly reliably reduces the content of microorganisms and their metabolites
- UV oxidation also reduces organic compounds in the water to ultra-low levels

Ready-to-use

- Feed water pressure switch, wall bracket, UV lamp, ultrapure cartridge, sterile filter, all included in one part number
- Leak detection standard and will alert user to leaks

Measurement of conductivity/resistivity

- Conductivity cells are carefully calibrated prior to each measurement via built-in reference resistance with cell constants at 0.01 cm⁻¹
- Temperature measurements are made by a platinum chip sensor with ± 0.1°C accuracy

Quick-connect cartridge replacement

 Aquastop quick-connect capability enables cartridge replacement within seconds even mid-operation

Exact dosing

- · High precision POM draw-off valve for dispensing with sterile filter
- Electronic dosing for fully automatic volume control of 0.01-65.0 L with
 2% accuracy

Push button simplicity for easy dispensing

GLP-compliant documentation

- Real-time clock and code-protected operating system prevents unauthorized changes to system settings
- RS-232 interface with adjustable send interval for safe data transfer of all measured data, faults, date and time to a PC computer or log printer
- Digital microprocessor control automatically monitors and stores faults from the last four weeks
- USP-compliant conductivity measurement with temperature compensation can be switched on or off

Tilting Control Panels for Easy Viewing

- Ergonomically designed controller tilts for ease-of-use and better visibility
- · Illuminated four-line alpha-numeric display

Thermo Scientific Barnstead MicroPure water purification system

The Barnstead MicroPure system was designed for laboratories that require up to 15 L/day of ultrapure water such as HPLC or other instrumental analyses, sample preparation, glassware rinsing, or molecular biology work in which endotoxins and/or nucleases would interfere.

APPLICATIONS INCLUDE:

Molecular Biology and Microbiology

- Cell and tissue culture
- · PCR, DNA sequencing
- Electrophoresis

Analytical Chemistry

- HPLC
- · GC, GC-MS, ICP-MS, AA
- TOC Measurements, IC

Smart features

- · Backlit display tilts for easy viewing
- · Variable speed dispensing
- Optional integrated 6 L feed water reservoir so you can place the system without direct access to a water line

Monitor feed water quality

 Good feed water quality leads to consistently ultrapure water and a longer cartridge service life to maximize cartridge life

Smart design

- Recirculation pump prevents bacterial growth during standstill and allows for constant monitoring of all system functions, allowing for the immediate display of fault messages if a problem is detected
- Systems ship fully equipped with pressure reducer, ultrapure cartridge and 0.2 µm sterile filter

Superior filters

- Ultrafilter is flushed automatically to assure the highest retention of endotoxins and nucleases, which produces a long two year lifetime
- Validated 0.2 µm final filter with folded membrane can be sterilized up to 5 times

UV Photo-oxidation 185/254 nm

- High performance UV assembly reliably reduces the content of microorganisms and their metabolites
- UV oxidation also reduces organic compounds in the water to ultra-low levels

<u>compact system</u>

for small ultrapure water demands

Thermo Scientific Barnstead E-Pure water purification system

The Barnstead E-Pure economically produces Type 1 water with low operating costs. Large cartridges provide longer cartridge life and an impressive system flow rate.

APPLICATIONS INCLUDE:

Molecular Biology and Microbiology

- Cell culture
- Buffer preparation
- Electrophoresis

Product Features

- Resistivities up to 18.2 MΩ.cm and TOC levels below 10 ppb
- · Virgin polypropylene water pathways prevent recontamination
- Recirculation pump continuously recirculates water throughout the entire system to maintain water purity and reduce the quantity of waste water required for rinse-up
- · Wall-mountable and completely assembled for easy installation
- · Quarter turn quick release canisters allow for easy cartridge replacement
- 0.2 µm absolute final filter removes bacteria and particulates protecting the integrity of your results
- Digital resistivity meter is automatically temperature compensated to 25°C, preventing fluctuating readings due to temperature changes
- · High-capacity cartridges provide low operating costs

Product Accessories

Remote dispenser

- . Delivers water up to 8 ft (2.4 m) from the system
- Ships with a mounting bracket for increased flexibility in choosing a mounting location

Low pressure pump protector

- If you are feeding your E-Pure system from a pressurized feed line, it is to your advantage to ensure that the pump is fully protected with the use of the low pressure pump protector
- Interrupts power if pressurized feed water line pressure falls below 5 psig (0.35 kg/cm²)
- Includes 6 ft (1.8 m) cord which plugs directly into the E-Pure
- Complete with 1/4 inch NPT "T" to install in your feed line

Low water level pump protector

- If feeding your E-Pure from a storage reservoir, it is recommended that a low
 water pump protector be added to the E-Pure system. This will ensure that the
 pump is protected in the event the reservoir does not have a sufficient quantity
 of water to satisfy the requirements of the system.
- Adaptable to most storage reservoirs, providing a 1/2 inch NPT connection is available. Includes 6 ft (1.8 m) cord which plugs directly into the E-Pure

Thermo Scientific Barnstead LabTower EDI water purification system

The Barnstead LabTower EDI is an integrated system combining purification with EDI technology and storage in one, as well as producing both Type 1 and Type 2 water. Stock high purity water safely and conveniently!

APPLICATIONS INCLUDE:

Type 1 Water Applications

- · Cell and tissue culture
- PCR, DNA sequencing
- · Electrophoresis, TOC Measurements, IC
- HPLP, GC-MS, ICP-MS, AA

Type 2 Water Applications

- · Rinsing lab glassware
- Supplying autoclaves and ultrapure water systems
- Preparing and diluting buffers, reagents, and media

Ultrapure water which exceeds ASTM Type I standards, with a resistivity of 18.2 M Ω .cm and TOC 1-5 ppb with optional UV lamp.

High purity water ASTM Type II water, with resistivity of 15-10 M Ω .cm, is ideal for daily needs of 100 to 500 L.

Two systems in one

- Unique systems with pretreatment plus polisher to produce both Type 1 and Type 2 water
- Type 2 water is stored in the integrated 100 L high purity water reservoir
- · Water system sits on top of the reservoir saving critical bench space

Ready-to-use

 Feed water pressure switch, all filters and cartridges, sterile filter, all in one package

Two ways to draw water

- Dispense ultrapure water directly from the system via the dispenser with sterile filter. The water quality is measured immediately prior to the dispensing point.
- Type 2 water is accessible from the reservoir, which is an ideal supply for lab equipment such as autoclaves

Performance for your application feeds

- High performance reverse osmosis module is paired with an EDI module and polisher cartridge
- . Two systems to choose from with capacities of 15 and 30 L per hour

dual quality system with EDI technology

Compact, stylish, mobile

- · Free-standing unit takes up no bench space
- · Easily relocated with bottom-mounted rollers

Safe operation

- Microprocessor control for automatic operation
- · Continuous monitoring of all critical parameters
- Recirculation pump protects purified water from bacterial growth during standstill

GLP-compliant documentation

- Real-time clock and code-protected operating system prevents unauthorized changes to system settings
- RS-232 interface with adjustable send-interval for safe data transfer of all measured data, faults, date and time to a PC computer or log printer
- Digital microprocessor control automatically monitors and stores faults from the last four weeks
- USP-compliant conductivity measurement with temperature compensation that can be switched on or off

100 L Integrated polyethylene reservoir safely stores Type 2 water

- Automatic water recirculation in the reservoir moves water across a special polisher module ensuring fresh Type 2 water on demand
- High-purity water reservoir outlet for convenient drainage
- Efficient cleaning and disinfection enhanced by conical bottom design for completely emptying reservoir
- Integrated reservoir provides 100 L of purified water storage
- Sterile vent filter and reservoir overflow prevents internal contamination by microorganisms from the surrounding air
- Optional CO₂ adsorber prevents CO₂ adsorption into the water, which would reduce cartridge life.
- Highly visible reservoir volume display on LabTower controller
- · Customize volume stored in the reservoir via the controller

Quickly view reservoir level (volume in %) with highly-visible continuous monitor

Thermo Scientific Barnstead LabTower EDI water purification system (continued)

Electrodeionization, EDI, unites two proven technologies for producing ultrapure water: Electrodialysis and ion exchange. In contrast to conventional ion exchange in which resins must be either chemically regenerated or the cartridge discarded, EDI utilizes an electric current for continual resin regeneration.

Technologies that keep you one step ahead

- Constant high efficiency of the ion exchange layer bed produces consistently high quality water
- No regeneration chemicals required and no disposal of cartridges, making this technology friendly for the environment
- · No exchange of spent resins or cartridges saves cost
- · High-purity water when you need it with no wait time

How EDI works

Several layers of ion selective membranes are situated between an anode and a cathode. Layered ion exchange resin beds and concentrate chambers are alternately positioned between them.

On applying an electric voltage, water (H $_2$ 0) is split into H $^{\scriptscriptstyle +}$ and OH $^{\scriptscriptstyle -}$ in the cell.

The H⁺ and Na⁺ cations can migrate through the cation permeable membranes, anions through the anion permeable membranes.

The ions migrate in the direction of the applied voltage, i.e. anions to the positive pole (anode), cations to the negative pole (cathode). The water ions that migrate through an ion exchange chamber displace salt ions retained by the ion exchange resins and so continually regenerate the resins.

The salt ions migrate through the appropriate ion selective membranes into the concentrate chambers and are flushed out by water. As all concentration chambers are flushed, excess $\rm H^+$ and $\rm OH^-$ ions can again combine to form $\rm H_2O$.

Thermo Scientific Barnstead Smart2Pure water purification system

All in one! The Barnstead Smart2Pure system is a compact system which converts tap water to into both ASTM Type I and II water. The Smart2Pure 3 and 6 feature a built-in 6 L reservoir to store the Type 2 water. The Smart2Pure 12 offers the choice of a 30 or 60 L reservoir for customizable storage capacity.

APPLICATIONS INCLUDE:

Molecular Biology and Microbiology

- Cell and tissue culture
- PCR, DNA sequencing
- Electrophoresis

Analytical Chemistry

- HPLC
- · GC, GC-MS, ICP-MS, AA
- TOC Measurements, IC

Routine Laboratory Work

- Preparing and diluting buffers and reagents
- · Rinsing lab glassware
- Supplying autoclaves and other small lab equipment

Powerful performance

Based on your requirements, choose from capacities of 3, 6 or 12 L/hr

Lasting economy

- Water purification progresses through independent cartridges with Aquastop quick-connect for fast replacement
 - Module 1 Combination of pretreatment and the reverse osmosis membrane
 - Module 2 Polishing cartridge contains high-quality ultrapure resin for consistent purity and long cartridge life

Easy-to-operate

- · Dispensing is easy and features variable speed to control flow
- · The display can be tilted for optimal reading
- · Optional UV bulb and ultrafilter to customize ultrapure water quality

Placement options

- Position on laboratory bench
- · Mount it on the wall

Smart2Pure 3 and 6 features smart, integrated 6 L reservoir

- · Constructed with pigment-free materials
- Conical bottom outlet allows for complete draining and efficient cleaning and disinfection

Smart2Pure 12 offers reservoir options, either 30 or 60L

- · Large opening for easy and effective cleaning by hand
- Sterile venting filter/reservoir overflow protects against contamination by microorganisms
- CO₂ adsorber prevents TOC value increases from drawn-in CO₂
- · Polyethylene reservoir is opaque to light
- Recirculation pump protects the high purity water from bacterial growth during standstills and maintains the low conductivity value
- Wall-mount optional for simple space-savings
- Conical bottom outlet allows for complete draining and efficient cleaning and disinfection

TYPE 2

POUTEwater purification systems

Pure water for a wide range of applications

Type 2 pure water is an essential part of creating consistently pure chemical reagents, microbiological buffers and media. Type 2 water is also recommended as a pretreatment for Type 1 ultrapure systems.

innovation

Advanced feed water monitoring alerts user to fluctuations in feed water quality to optimize cartridge

convenience

Aquastop connections allow users to quickly change the cartridge and minimize downtime

flexibility

Gain more space with numerous installation options — on the bench, wall or standalone

Thermo Scientific Barnstead Pacific TII water purification system

The Barnstead Pacific TII water purification system converts tap water into high purity water. The ultimate system for the automatic and economical production of Type 2 water, the Pacific TII system supports daily requirements from 20 to 200 liters.

ROUTINE LABORATORY WORK

- · Rinsing lab glassware
- Supplying autoclaves and ultrapure water systems
- Preparing and diluting buffers, reagents, and media

Multiple options for Type 2 water

- Five system options with permeate flows of 3, 7, 12, 20, or 40 L/hr
- Future system upgrades accommodate greater capacities to meet growing water demands
- Space-saving design permits benchtop installation or wall mounting with integrated mounting bracket

Operational reliability

- Microprocessor controlled for automatic operation with continuous monitoring of all critical parameters
- Automatic return to "operating" mode ensures recirculation during standstill periods
- Optional UV lamp prevents biological contamination

Easy-to-operate

- Resistivity/conductivity clearly displayed on large back-lit control panel that tilts for optimum viewing
- Status of current operating mode clearly indicating "production", "stand-by", "cleaning" or "disinfection" modes
- · Reservoir fill-level shown as %
- System parameters are code-protected to prevent accidental changes to set points
- Water is dispensed directly from storage tank

GLP-Compliant documentation

- . Optional printer connects to RS-232 port for data recording and traceability
- Cell constant of 0.01cm⁻¹ ensures precise conductivity measurements
- Temperature compensation for the conductivity measurement has an accuracy of ±0.1°C (in conformity with USP 645)

Volume display

• Water level % in reservoir is shown automatically on the Pacific TII display

Clear information

Large, illuminated four-line display is easy to read and provides information on:

- Operating mode status, such as production, stand-by, disinfection
- Reservoir volume in %
- Temperature in °C

type 2 water system with ultimate flexibility

Technologies that produce high purity water —

Reverse osmosis membrane

The high performance reverse osmosis membrane removes approximately 98% of inorganic ions and 99% of all dissolved organic substances as well as microorganisms and particles.

High purity water cartridge

This cartridge further purifies the reverse osmosis permeate to produce high purity water as required by international standards (ASTM Type II, CAP, ISO 3696, BS 3997 and CLSI).

UV lamp (UV version only):

The 254 nm UV transmission ensures optimal UV irradiation. Light of wavelength 254 nm acts as germicide.

Recirculation

Recirculation of the water between the storage reservoir and Pacific TII is important for maintenance of the water quality. Water from the reservoir is cycled through the high purity water cartridge and the UV chamber, then back to the reservoir. (available only for systems that include a tank with recirculation/pressure pump)

Thermo Scientific Barnstead Pacific TII water purification system (continued)

The Barnstead Pacific TII system converts tap water to 15-10 MΩ·cm high purity water.

Pacific TII reservoirs

• Store high purity water safely and conveniently!

Large opening

· For easy and effective cleaning by hand

Optional safety filters:

- A CO₂ adsorber prevents conductivity increases from drawn-in CO₂
- Sterile overflow prevents microorganisms from entering and contaminating reservoir water

Polyethylene reservoir

· Constructed with inert materials opaque to light

Recirculation pump

 Recirculation pump protects high purity water from bacterial growth during standstill while maintaining a low conductivity value

Wall mount

• Simple and space-efficient wall mounting

Conical bottom outlet

• Allows complete draining and efficient cleaning and disinfection

Thermo Scientific Barnstead LabTower TII water purification system

The Barnstead LabTower TII converts tap water into high-purity water and provides water storage for a complete Type 2 water solution.

ROUTINE LABORATORY WORK

- · Rinsing lab glassware
- Supplying autoclaves and ultrapure water systems
- Preparing and diluting buffers, reagents, and media

Consistent water quality

- Type 2 laboratory water meets ASTM Type II, CSLS-CLRW and ISO 3696 international standards
- Designed to continuously recirculate purified reservoir water to preserve water quality even during periods of inactivity

Compact mobile design

- . Two system options with permeate flows of 20 or 40 L/hr
- Stand-alone design with integrated 100 L reservoir takes up zero bench space
- · Castors allow easy relocation
- · Systems can be upgraded later to accommodate growing water demands

Two ways to dispense water

- Dispense directly from the system via the dispensing valve for calibration solutions, reagent preparation, filling of containers, general rinsing purposes, etc.
- Dispense from the reservoir to supply autoclaves, dishwashers, ultrapure water systems, etc.

Integrated 100 L reservoir

- Up to 100 L of high purity water ready for dispensing when needed
- · High purity polypropylene reservoir is opaque to light
- Conical bottom allows complete emptying for efficient cleaning and disinfection
- Adjustable setting for reservoir volume can be programmed for times when demand is low, allowing you to only store water that you can use

Clear information on system display

- The large four-line display is code-protected to prevent accidental changes in system settings
- Illuminated and easily readable, the display provides information on resistivity or conductivity, operating mode status, such as "production", "stand-by" or sanitization, and volume of the reservoir in %

GLP-compliant documentation

- · Developed to meet or exceed GLP requirements
- Recorded and traceable data can be obtained by print-out via the RS-232 interface and accessory printer
- Highly qualified and precise measurement of the conductivity is ensured by the cell constant of 0.01 cm $^{-1}$ to an accuracy of \pm 0.1°C

Quick Look Comparison		
	LabTower TII system	LabTower TII + UV system
Pure water production at 15°C, L/hr	20 or 40	20 or 40
Resistivity at 25°C, MΩ·cm	10-1	10-1

0.1-1

0.1-1

Bacteria content, CFU/mL, with sterile filter < 1 < 1 Particle content (0.2 µm) per mL with sterile filter < 1 < 1

Pretreatment

Conductivity, µS/cm

- 5 µm prefilter and activated carbon in the combi-filter cartridge protects the RO membrane from chlorine and particles
- · Hardness stabilizing cartridge protects the reverse osmosis stage from hard water

Reverse osmosis and reservoir

- · Pretreated water is pressure-forced through the permeable reverse osmosis module removing 97-99% of all inorganic ions, 99% of dissolved organic substances as well as microorganisms and particles
- . The built-in 100 L reservoir has a conical bottom outlet to optimize cleaning and sanitization

Ion exchange and UV

- RO membrane removes up to 99% of impurities. All remaining ions are removed by the low TOC, high-purity resins in the ion exchange cartridge.
- Irradiation with UV light (TII units with UV option only) eliminates any bacteria or germs that are present

LabTower TII with optional hand dispenser

Thermo Scientific Barnstead Mega-Pure Glass Stills

Barnstead Mega-Pure Glass Stills effectively remove inorganic solids, organics with boiling points higher than water, bacteria, and pyrogens. The stills are constructed of non-leaching components to ensure high purity water.

Product FeaturesContact with only of

- Contact with only glass, quartz and Teflon® components ensures ultimate purity and eliminates cross-contamination
- · Choice of five production capacities
- · Units are easily wall- or bench-mounted
- · Vertical condenser design provides maximum purity
- High temperature cut-off shuts down the still if the temperature is too high, preventing heating element burnout
- · Quick release cover provides easy cleaning access
- Connection to Automatic Collection System (ACS) assures a 24-hour automatic system
- · Includes feed water solenoid valve for automatic operation
- Produces water with a resistivity of 1-10 M Ω -cm, depending on feed water purity

MP-1

 Compact, easy-to-use 1 L/hr glass still available with or without a storage bottle

MP-3A, MP-6A and MP-11A

• Ideal for larger volume demands with storage and options

MP-12A

Built-in deionizer for pretreated feed to boiler. Distillate cooler allows product
water to be used as it is produced, cooling it from 85-55°C for ease of handling.
No need to wait for cooling

Product Accessories

Automatic Collection System (ACS)

- · All glass system designed to collect water from the Mega-Pure Glass Stills and control their operation
- · Generous 45 L capacity
- · Easy wall- or bench-mount
- · Preset to shut off the power to the heaters and the water supply to the still after the bottle has collected approximately 45 L
- · The system will automatically restart the still and refill the collection system when the purified water supply has been depleted to approximately 38 L

Pretreatment for hard water

- · Allows for pretreating feed water to Mega-Pure Glass Stills
- · Mega-Pure single or dual cartridge deionizer reduces scale build up and increases distillate purity
- · Greater flexibility in meeting varying feed water qualities
- Temperature-compensated purity meter measures water quality and indicates when cartridges are exhausted
- · Built-in drain valve for simple cartridge changes
- · Large cartridge capacity for extended cartridge use
- · Unit can be wall- or bench-mounted

	Adapter for ACS washer hook-up for glassware washers	440241

Thermo Scientific Barnstead Classic Stills

Barnstead Classic Stills effectively remove inorganic solids, organics, bacteria, and pyrogens. The stills are constructed of copper and bronze with a coating of pure tin. The inert nature of tin prevents any leaching of contaminants into the water.

ROUTINE LABORATORY WORK

- · Rinsing lab glassware
- Supplying autoclaves and ultrapure water systems
- Preparing and diluting buffers, reagents, and media

Product Features

- · Double-walled boiler and preheating of feed water conserves electricity
- · Vented condenser allows for stripping of gaseous impurities
- Unique de-concentrator removes scale forming impurities from the boiler
- Unique Thermo Scientific Q-Baffle ensures high quality pyrogen free water by stripping contaminant laden water droplets from steam
- · Space-saving horizontal condenser
- · Metal construction withstands years of use
- Units are easily floor and bench mountable, depending on model
- · Inert pure tin pathways assure product water quality
- · Controller unit can be wall mounted

Portable Stills

- Requires no permanent plumbing or electrical connections, allowing quick set-up
- Includes low water cut-off for safety protection
- Bench-mounted

Floor Model Electric Stills

- · Come standard with floor mounting stand
- · New over temperature protection system improves safety
- New plug-and-play hardware allows for easier installation
- · Capacities from 1 to 10 gal/hr
- · Low water cut-off protects heating elements when water supply is interrupted
- · Optional fully automatic controls allow for unattended operation
 - Stops still when storage reservoir is full, starts still when water level falls below preset level
 - Drains still boiler at selected 4-hour intervals to reduce scale formation

Steam Still

- · Utilize available in-house steam as heat source
- Optional automatic controls allow for unattended operation
 - Stops still when storage reservoir is full, starts still when water level falls below preset level
 - Drains still boiler at selected 4-hour intervals to reduce scale formation

tin lined for pure water

Thermo Scientific Barnstead Classic Still Storage Reservoirs and Accessories

Select a Barnstead Classic Still Storage Reservoir and mounting option that will best fit your needs. The Ventgard Air Filter, Water Seal and UV Light Assembly are required accessories that will protect your pure water during storage.

Storage Reservoir Floor Stand

Storage Reservoir Wall Bracket

Storage reservoirs

- Available in 10 to 200 gallon reservoir options
- Crafted from copper and hand-wiped with pure tin to ensure the purity of the distilled water
- All reservoirs include a removable cover, water level sight glass and a tin coated draw-off faucet with serrated hose nipple
- Connections provide for optional accessories including pumps and fully automated controls
- Requires a floor stand or wall bracket (10 and 25 gallon reservoirs only) for proper installation

Required Accessories

Floor stand and wall bracket

Choose either a floor stand or wall bracket for proper installation of reservoir

Floor stands

- 10, 25 and 50 gallon reservoir stands are fabricated from heavy gauge sheet metal and have adjustable feet
- 100 and 200 gallon reservoir stands are fabricated of thick steel angle-iron

Wall brackets

- 10 gallon reservoir brackets are fabricated from heavy gauge aluminum
- 25 gallon reservoir brackets are fabricated of thick steel angle-iron

Ventgard air filter and water seal

- Protects the stored water against airborne particulates, organics and CO₂
- Water seal works as a one-way valve to allow distilled water into reservoir
- Prevents air from entering the reservoir via the condenser atmospheric vent

UV light assembly

- · Maintains sterility in the reservoir
- UV lamp is enclosed by a tubular, transparent, inert sheath
- When lamp changes are necessary, only the lamp needs to be removed. The
 reservoir cover and sheath remain in place eliminating any exposure of water to
 contamination from the air

Thermo Scientific Barnstead Cabinetized Stills

Our Barnstead Cabinetized Stills include a still and an appropriately matched tin-coated storage reservoir in a compact storage cabinet. This space saving design uses less space than conventional units and allows for faster installation.

<u>all-in-one</u>

tin-lined still and reservoir

ROUTINE LABORATORY WORK

- Rinsing lab glassware
- Supplying autoclaves and ultrapure water systems
- Preparing and diluting buffers, reagents, and media

Product Features

- · Choice of two sizes; 2 or 5 gal/hr
- · Q-Baffle ensures high quality pyrogen free product water
- Fully automatic operation allows for unattended operation. Still turns off when
 the reservoir is full and restarts when reservoir empties. Automatically drains
 the boiling chamber every time the unit is off and every 4 hours of operation,
 helping to keep your still clean.

Model 210 Still - 2 gal/hr with 10 gallon reservoir

- · Purity meter alerts user of distilled water purity in storage reservoir
- Includes low water cut-off for safety protection

Model 525 Still - 5 gal/hr with 25 gallon reservoir

- · Purity meter alerts user of distilled water purity in storage reservoir
- · Optional recirculation pump and base mounting stand available
- Storage tank equipped with a UV lamp for improved bacterial control

distillation 101

Distillation effectively removes most inorganic solids, all organics with a boiling point greater than water (100°C), all bacteria and pyrogens. Gases and low molecular weight organics are not effectively removed by distillation.

Thermo Scientific Barnstead products include a broad range of stills

Our stills range in size from 1.4 to 38 L/hr. Select from stills constructed of tin or glass. Many models offer fully automatic options or pretreatment options to minimize scaling.

Still components

A still includes a boiling chamber (boiler), electric or steam immersion heaters, pyrogen reducing baffle, condenser, constant level device and low water cutoff. Options include pretreatment solutions and fully automatic controls that allow stills to work automatically with pretreated feed water and a storage reservoir.

Step-By-Step technologies used in distillation systems

- 1 Feed water enters the still through the Cooling Water/Feed Water Inlet. As the water passes through the Inlet, it becomes warmed as it makes its way to the boiler. It in turn cools the vapor entering the condenser.
- Water flows from the condenser into the constant level device, then into the boiler.
- 3 The water in the boiler is heated. Impurities with a boiling point higher than water (100°C / 212°F) remain in the boiler, while water and impurities with a boiling point equal to or lower than water are converted to water vapor. The pure vapor moves up the boiler through a pyrogens-reducing baffle and into the condenser.
- In the condenser, the pure vapor is transported through the condenser where it contacts tubes or coils containing cooling water. The pure vapor contacts these tubes and coils and is condensed to produce pure water.
- 5 The distilled water exits the condenser and is stored in a reservoir through the Distilled Water Outlet.
- 6 Atmospheric vent allows for volatile contaminants to be vented, increasing the purity of the distilled water.

reverse osmosis

water purification systems

Water purified using reverse osmosis is useful in supplying water to lab equipment such as water baths, dishwashers and autoclaves.

innovation

Thermo Scientific Barnstead LabTower RO system allows the tank level to be set manually

convenience

Dispense easily from the tank

Endless mounting choices – on the bench, on the wall, or free-standing

reverse osmosis

Reverse osmosis is economical

Reverse osmosis is the most economical method to remove up to 99% of impurities in feed water. The RO membrane is semi-permeable with a thin microporous surface that rejects virtually all dissolved materials including inorganic solids, organics, particles and microorganisms.

Reverse osmosis water is versatile

RO water can be used to prepare microbiological buffers and chemical reagents. Additionally, it is a great option for use in general laboratory equipment, such as water baths, humidifiers, and autoclaves.

Reverse osmosis is effective

As the feed water passes through the RO membrane, impurities deposit on the surface of the RO membrane and are flushed away to the drain. The result is purified product water free of up to 99% of its impurities. The specific rejection rates of all the impurities are shown in each of the product specifications.

Feed water factors

Certain characteristics of your feed water directly relate not only to membrane performance and lifetime but also directly impact the quality of your product water.

Take advantage of our Thermo Scientific $\rm H_2O$ Select Analysis Kit, our free comprehensive testing program which will analyze your feed water to ensure optimum RO performance.

The natural osmosic flow of water through a semi-permeable membrane from less concentrated solutions to more concentrated solutions. Reverse osmosis is achieved when external pressure is applied to reverse this natural flow, as shown on the right.

Our technical service experts are a great resource for any feed water questions you might have.

Here is an explanation of key characteristics impacting RO performance:

Temperature

Volumes listed for the reverse osmosis product water are based on a feed water temperature of 15°C (59°F). For every 1°C below 15°C (59°F), the quantity of product water is reduced by 3%. Additionally, if the feed water temperature goes beyond 25°C (77°F), the RO membrane may be damaged. We recommend a hot and cold water mixing valve to regulate the temperature to 15°C (59°F).

Alkalinity and calcium

Carbonates, bi-carbonates, hydroxides and calcium impurities in your feed water contribute to RO membrane scaling. Both the Thermo Scientific Barnstead Pacific RO and Thermo Scientific Barnstead LabTower RO systems have pretreatment solutions to prevent this. Included in the pretreatment system is a hardness stabilizer cartridge which binds calcium, thereby protecting the RO membrane.

Chlorine

Chlorine can damage the RO membrane and reduce its performance and useful life. Again, both Pacific RO and LabTower RO have solutions to pretreat the water, which includes a 5 μ m prefilter + activated carbon cartridge to prevent entry of particles > 5 μ m and high concentrations of free chlorine.

Turbidity

The turbidity level indicates the amount of suspended solids present. This suspended material can shorten the life of filters and reverse osmosis membranes if not removed. Our Pure Water Experts can recommend pretreatment options if turbidity is an issue with your feed water. RO membranes show very little fouling when the feed water has a turbidity of less than 1 NTU.

SDI (Silt Density Index)

Suspended solids and colloidal materials in feed water are one of the biggest problems in reverse osmosis systems. In order to have some measure of the degree of this fouling problem, a concept called Silt Density Index is used. Here a 0.45 μm filter is exposed to the feed water under pressure and filtration rates are calculated. A SDI of $<\!5$ is considered acceptable for the reverse osmosis systems.

LabTower RO with optional hand dispenser

Thermo Scientific Barnstead LabTower RO water purification system

The Barnstead LabTower RO Converts Tap Water into RO Water and stores it in an integrated 100 L reservoir

ROUTINE LABORATORY WORK:

- Rinsing lab glassware
- Supplying autoclaves, water baths, incubators and glassware washers
- Preparing and diluting buffers and reagents
- General biotechnology

Advanced technology in a mobile design

- · An ultra-modern controller provides easy-to-read system parameters
- Completely drainable integrated 100 L high-purity water reservoir has a low-noise pressure booster as a standard component
- Mounted on casters, the compact LabTower RO system is an ideal pure water supply for any laboratory. Ideally suited as a feed water source for dishwashers, autoclaves and general laboratory use
- A built-in pretreatment unit, consisting of a hardness stabilizer for protection of the reverse osmosis module from hardness formers
- An activated carbon/5µm combi-cartridge protects the system against free chlorine and particles, ensures the long service life of downstream purification stages

Compact and mobile design

- Two system options with permeate flows of 20 or 40 L/h
- Stand-alone design with integrated 100 L tank takes up ZERO bench space
- · Casters allow for easy relocation
- Systems can be upgraded later to accommodate growing water capacity demands

Integrated 100 L reservoir

- 100 L RO water storage in a high-purity polyethylene PE opaque reservoir
- Adjustable reservoir volume can be programmed for times of low demand
- Dispense from the reservoir to supply autoclaves, glassware washers, incubators, etc

Easy-to-operate clear display

- Resistivity/conductivity clearly displayed on large back-lit control panel that tilts for optimum viewing
- Status of current operating mode clearly indicating "production", "stand-by", or "cleaning" modes
- Reservoir fill-level shown as %
- System parameters are code-protected to prevent accidental changes to set points

GLP-compliant documentation

- Developed to fulfill GLP requirements
- Recorded and traceable data can be obtained by print out via the RS-232 interface and accessory printer
- Highly qualified and precise measurement of the conductivity is ensured by the cell constant of 0.16 cm⁻¹

Thermo Scientific Barnstead Pacific RO water purification systems

The Barnstead Pacific RO system is a modularly designed laboratory reverse osmosis system specifically developed for functional and economical production of high-purity water.

ROUTINE LABORATORY WORK:

- Rinsing lab glassware
- Supplying autoclaves, water baths, and incubators
- Preparing and diluting buffers and reagents
- General biotechnology

Product Features

- Five system options with permeate flows of 3, 7, 12, or 20, or 40 L/h
- Space-saving design allows system to sit on the laboratory bench or be mounted on the wall
- R0 membrane removes organic and inorganic contaminants, microorganisms, particles and colloids
- Simple system upgrade accommodates future pure water capacity requirements

Reliable operation

 Microprocessor control offers automatic operation with continual monitoring of all important parameters

Easy-to-operate clear display

- Resistivity/conductivity clearly displayed on large back-lit control panel that tilts for optimum viewing
- Status of current operating mode clearly indicates "production", "stand-by", or "cleaning" modes
- · Reservoir fill-level shown as %

Integrated feed water monitoring

 Good quality feed water is a prerequisite for high purity water and extends cartridge service life

GLP-compliant documentation

- · Real-time clock records system errors and faults
- Ongoing data storage collects four weeks information displayed in clear text
- Operating system is code-protected to prevent unauthorized changes to system settings
- RS-232 interface with adjustable sender interval allows for customized timing of data transmission of measured values and faults to a PC or data printer
- Cell constant of 0.16 cm⁻¹ ensures precise conductivity measurements

Pacific RO pretreatment

 Two 10 inch (25.4 cm) cartridge filter housings with a 5 µm prefilter + activated carbon to prevent entry of particles > 5 µm and high concentrations of free chlorine. Also includes hardness stabilizer cartridge which binds calcium and prevents its precipitation.

Worry-free pure water storage

- · Reservoir are constructed of pigment-free polyethylene
- · Conical bottom allows for easy cleaning, disinfecting and complete emptying

flexible configurations for your RO water needs

pretreatment

Not all feed water sources are equal!

Pretreatment is sometimes necessary to maximize the effectiveness of water purification systems. Poor water quality can also shorten the life of water system consumables.

Mixed Multi Water Softener

- · Ideal system to treat hard feed water
- Not only softens the water, but also protects the RO membrane from blockage
- Removes calcium, magnesium, iron, and manganese and a great variety of suspended matter and organic material
- Combination of multiple stages, from porous polymeric adsorbers to ion exchangers
- Necessary for feed water with a silt density index (SDI) that is greater than 3 or the total ionized solids (TIS) is greater than 250 ppm

Single Pretreatment Cartridge

- Easy-to-use pretreatment cartridge protects the RO membrane in a system against particles
- Ships with 10-inch filter housing and a 1 µm filter
- Ideal when feed water Silt Density Index (SDI) is 2-3

Double Pretreatment System

- Ships with two 10-inch filter housings, a combi-cartridge which contains a 5 µm filter and activated carbon, and a hardness stabilizer cartridge
- · Removes chlorine, organics, and hard ions

Triple Pretreatment System

- Ships with three 10 inch filter housings a combi-cartridge which contains a 5 µm filter and activated carbon, and a hardness stabilizer cartridge, and a 1 µm filter
- An effective triple pretreatment system removes chlorine, organics, hard ions, and particles larger than 1 μm

Double Pretreatment System

Not sure what you need?

Request a complimentary Thermo Scientific H₂O Select analysis kit and let us analyze your feed water. Your report will include a recommendation of any pretreatment system needed for your water purification system.

Thermo Scientific Barnstead pretreatment Selector guide

Use pretreatment when your feed water quality doesn't match the requirements for your system.

Water Type	Solutions	Voltage	Descriptions	Model Number
RO Water	DI 1500 cartridge Required only when feed water does not meet feed water requirements. Prolongs system cartridge life. For new installations, 04.1690 is a required hose kit to adapt cartridge to system.	stainless steel cartridge >	02.1500	
Deionized or Distilled Water	Deionized and distilled water will meet the feed water requirement No pretreatment is typcially required.	s for the Ther	mo Scientific GenPure and MicroPure familie	S.

What is SDI?

SDI stands for silt density index (SDI). When the SDI of feed water is >3, it can quickly ruin your RO membrane

- SDI is a measure of the fouling capacity of water in RO systems
- The test measures the rate at which a 0.45 µm filter is plugged when subjected to a constant water pressure of 30 psi
- SDI gives the percent drop per minute in the flow rate of the water through the filter, averaged over a period of time such as 15 minutes

cartridges and filter systems

We offer a complete line of cartridge and filter systems for all your single step purification and pretreatment needs. Use the Thermo Scientific Bantam Deionizer, Hose Nipple Cartridges or B-Pure cartridges for simple, single- step purifications.

innovation

Joints and seams are ultrasonically welded to prevent contamination from chemical adhesives

Quick-release designs provide easy cartridge change-outs and simplify maintenance, bypassing the costs of service calls

flexibility

Versatile configurations meet an array of specific applications

Thermo Scientific Barnstead cartridge & filter selector guide

Choose the feature you need	Technology / Feature	Benefits
	Digital Purity Indicator	Digital purity indicator features real-time readout of resistivity values; useful with more sensitive applications
Purity Indicators	Pura-Lite "Go/No Go" / Analogue Resistivity Indicator	Quick glance monitoring to notify user when it's time to install a new cartridge. Useful if cartridge system feeds a piece of lab equipment, such as an autoclave, where real time resistivity is not required.
	Color Change – Cartridge	Color change indicates when the cartridge is beyond its useful life and must be replaced. Useful for general lab applications.
	Remote Dispenser	Hand dispense water from the cartridge system. Ideal for rinsing glassware or filling a waterbath.
Added Features	Wall Mounted	Saves laboratory bench space. Ideal configuration for autoclaves and dishwashers where no bench space exists.
Added Features	Quick Release Canisters	Allows for fast and simple cartridge change-outs.
	Maximum Flow Rate L/min	

PRESSURIZED SYSTEMS

NON-PRESSURIZED WATER SYSTEMS

Thermo Scientific Barnstead B-Pure water system

The Barnstead B-Pure is an economical laboratory grade water system with flow rates up to 4 L/min that can be customized to meet your specific applications. Choose from single or double holders depending on your application needs.

APPLICATIONS INCLUDE:

- Pretreatment
- Deionization
- · Organic and chlorine removal
- · Feeding laboratory equipment

- Customize your water system to meet your application needs. Modular design provides the ability to add additional holders when the need arises
- Produces up to four L/min
- Quarter turn quick release canisters make changing cartridges simple
- Accepts Thermo Scientific Barnstead Pura-Lite purity indicator or digital purity meter to monitor water quality
- Available in full or half-size cartridge configurations supporting space constraints

Single holder

- Produces up to four L/min
- · Simple system without a draw-off valve or purity indicator

Double holder

- Produces up to four L/min
- · Complete with draw-off valve
- Choose from models with digital purity meter or Pura-Lite™ "Go/No Go" resistivity indicator

Half-size holder

- Produces up to 2 L/min
- · Easily attaches to full size B-Pure systems
- · Small size allows for flexibility in mounting location

Quick Look Comparison	
Resistivity reading	Flow rate
1-10 $M\Omega$.cm (depending on cartridges used)	Up to 4 L/min

customizeable for your pretreatment or deionization needs

Harvey DI+ Cartridge System

- · Turn-key system ships complete with a remote dispenser, Pura-Lite (50 KΩ·cm) indicator and a high capacity, two-bed ion exchange cartridge to remove calcium, magnesium, and other ions from water
- The Harvey DI+ system accepts a broad range of other cartridges to remove impurities and produces pure water at a flow rate of 4 L/min

Thermo Scientific Bantam Deionizer

The Bantam Deionizer is an economical way to deionize your water. Easily view resistivity readings directly from unit. Customizable to specific applications by selecting the appropriate cartridge listed below.

simple deionization system

ROUTINE LABORATORY WORK:

- Pretreatment
- Deionization
- · Organic and chlorine removal

- · Ideal for applications requiring up to 38 L/hr of purified water
- · Select the cartridge to best meet your application needs
- · Point of use polishing of pretreated water or single stage treatment of tap water
- · Direct reading purity monitor
- Designed for non-pressurized applications. Output water must be diverted to an atmospherically-vented receptacle, no back pressure can be accepted
- Minimum inlet pressure 5 psi, maximum inlet pressure 70 psi
- Includes 3 ft (0.9 m) of inlet feed tubing

Quick Look Comparison	
Resistivity reading	Flow rate
25,000-18,000,000 Ω-cm	Up to 38 L/hr

Choose the ca your applicat	artridge based on ion needs.		Resin Type(s)	Capacity	Model Number
High capacity Removes ionized impurities, produces a larger quantity of water than that of the Ultrapure (D0809), however at a lower resistivity			Two-Bed lon Exchange	1760 grains	D0803
Ultrapure Removes ionized impurities to produce highest resistivity water with a neutral pH			Mixed-Bed	875 grains	D0809
Ultrapure and organic removal (pretreatment) Commonly used as still pretreatment. Removes ionized impurities and has a layer of activated carbon to remove chlorine and organics			Mixed-Bed, Activated Carbon	785 grains / 1000 gal	D0832

Thermo Scientific Barnstead Hose Nipple Cartridges

The Barnstead Hose Nipple Cartridges are an economical way to purify water volumes up to 75 L/hr Applications include softening, deionization, organic and chlorine removal.

easily customizable cartridge holder

- · Economical purification option
- · Ideal for small volume applications
- Same superior quality resins used in B-Pure cartridges
- Constructed of 100% virgin polypropylene cartridge
- Designed for non-pressure applications, these cartridges include 3/8 inch barb hose connections on each end. D8822, D8950, and D8951 cartridges include tapered straight nipple for 3/8 inch ID tubing
- Color change indicator identifies when resin is exhausted in specific cartridges
- · Simple cartridge holder is easily wall mounted

Thermo Scientific Barnstead 1/2 Size B-Pure Filter

Barnstead 1/2 Size B-Pure Filters will meet all your prefiltration needs.

The filters can be used to pretreat feed water or act as a final filter to ensure consistently pure water.

ROUTINE LABORATORY WORK:

· Particulate and bacteria removal

Product features

- Large surface area ensures long life
- · Flow rates of up to two L/min

Choose from two holder options:

1/2 Size B-Pure Filter Holder

- Natural polypropylene material construction maintains purity
- · Filters are easily and quickly replaced with quarter turn quick release canisters
- Accepts 10 inch (25.43 cm) pre- and post-filters
- · Wall mounting bracket comes standard

Economy Filter Holder

- Accepts 10 inch (25.43 cm) double open-ended filters
- Can be piped into any water line

Optional accessory

Pressure Gauge Kit

- · Attaches to any B-Pure system
- 0 to 160 psi pressure gauge allows for monitoring inlet and outlet water pressure.
- Monitors pressure drop across any of the 10 inch (25.43 cm) filter cartridges used in the 1/2 Size B-Pure Filter Holder
- Pressure drop of greater than 10 psi indicates need for filter change

Economy Filter Holder

Already have a Thermo Scientific water purification system?

This is where you can find the replacement consumables for your previously purchased Thermo Scientific water purification system.

Regularly changing filters and cartridges protects your water quality

Water purification systems can only produce pure water when the cartridges and filters are changed according to the operational manuals. Regular maintenance of your water system will ensure the product water is consistently the highest purity.

Cleaning your purification system allows bacterial contaminants to be flushed away.

Cleaning syringe		CMX25	CMX25	CMX25	CMX25

Thermo Scientific Barnstead EasyPure RF System Consumables					
177	EasyPure RF	EasyPure RF UV			
1		D7031	D7035		
Replacement Consumable	es				
Cartridge pack Choose the cartridge pack	Deionized feed	D502126	D502124		
according to your feed water and system	RO or distilled feed	D502127	D502125		
0.2 µm final filter		D3750	D3750		
Ultraviolet lamp	n/a	LMX13			
Ventgard™ reservoir cap		CV703X4A	CV703X4A		
Set of three empty cartridges for cleaning		D7034	D7034		

Thermo Scientific Barnstead EasyPure RoDi System Consumables				
	EasyPure RoDi			
	D13321			
Replacement Consumables				
Cartridge kit Includes pre-filter, ultrapure mixed bed cartridge, and EasyPure high purity/low TOC cartridge	D502133			
0.2 µm final filter	D3750			
Ultraviolet lamp	LMX13			
Ventgard™ reservoir cap	CV742X5A			
Reverse osmosis membrane	FL1332X2			
Set of three empty cartridges for cleaning	D7034			

Thermo Scientific Barnstead TII System Consumables		
		Barnstead TII
	TII 12 L/h	D14031
	TII 24 L/h	D14041
Replacement Consumables		
TII DI cartridge pack Ships with 0.2 µm final filter (D3750)		D502137
1 μm pre-filter		D502113
MPS cartridge		D502114
Extruded carbon cartridge		D502115
0.2 µm final filter		D3750
Reverse osmosis membrane		FL1265X1
Ultraviolet lamp (system)		LMX13
Ultraviolet lamp (reservoir)		LMX31
Ventgard reservoir cap		25001-DB

Thermo Scientific Barnstead RO System Consumables			
		Barnstead RO	
	R0 6 L/h	D12671	
	RO 12 L/h	D12651	
	RO 24 L/h	D12661	
Replacement Consumables			
Reverse osmosis membrane	6 and 12 L/h	FL1265X1	
	24 L/h Requires 2 RO membranes	FL1265X1 (please order 2)	
1 μm pre-filter		D502113	
MPS cartridge		D502114	
Extruded carbon cartridge		D502115	
Ventgard reservoir cap		CV742X5A

support and maintenance

Contact the Lab Water Experts

Have a question or concern, contact our PURE Water Experts!

Technical Questions

Our technical service team is ready to answer any of your questions on your existing systems.

Customer Service

Let our professional and experienced customer service representatives guide you when choosing your water system. They will evaluate your needs, develop a system recommendation and coordinate the installation of your water system.

New Lab Construction

We offer the most comprehensive line of water purification systems in the world. We can design a water system to meet your new lab's needs.

Services

Maintaining your water purification system is crucial to the overall productivity of your laboratory, the long-term performance of the system and the total cost of ownership. We offer a variety of services to suit your individual needs. Professional service delivers improved productivity, convenience, peace-of-mind and budget control.

Preventive maintenance

To ensure your system is working within specifications, regular maintenance is essential. We offer various service options and preventative maintenance, which will extend the working life, protect your system and prevent costly breakdown.

Installation

Our factory-trained technicians can install your system to ensure it operates with precision. With our services, you will receive:

- Installation scheduled at your convenience
- Assurance that all technical specifications are met
- Practical hands-on instructions

Validation

We offer validation services according to cGMP/GLP regulations, certifying that your system is performing to pre-determined technical specifications. Our validation services provide you with:

- Factory-trained experts experienced in cGMP/GLP environments and Good Document Practice
- IQ/OQ factory-developed validation protocols

Please ask your local sales representative for additional information about service offerings in your area.

Go Green

Smart Green designs mean a great water system for you and a smaller impact on the environment!

Our engineers created water systems with the environment in mind:

Reduce

Our cartridges use high quality resin to extend the useful life of the cartridge. Extended life reduces the need to replace your cartridges which, in turn, reduces the waste stream and improves your laboratory's sustainability. You'll use your cartridges longer, reducing the need to reorder, ship, handle and dispose of your cartridges.

Our units are designed to minimize the amount of water that is used during the analysis.

To provide the customer with pure water and low power consumption, our units go into a low energy mode after dispensing without sacrificing water quality for your applications.

Reuse

Our cartridges were engineered with the environment in mind. The plastic cartridge casings and endcaps are constructed using virgin polypropylene to allow for easy recycling after end of life. The cartridge is assembled in a clean environment using environmentally friendly ultrasonic welding that minimizes energy usage compared to other joining as well as avoids the use of any environmentally unfriendly solvents. Our conscious effort to avoid chemical solvents and adhesives makes the plastic and resin suitable to be recovered, reground and reused for a variety of alternate uses.

Common Conversions

Common Conversions for Pure Water		
Volume	1 U.S. Gallon (gal) = 231 Cubic in (in³) = 3.785 Liters (L)	
	1 Cubic Meter (m³) = 35.3 Cubic Feet (ft.³)	
	1 U.S. Ounce (oz) = 29.57 Milliliters (mL)	
Density	1 U.S. Gallon (gal) = 8.33 lb. Water	
	1 Cubic Foot (ft.3) = 62.3 lb. Water	
Temperature	$^{\circ}F = (^{\circ}C \times 9/5) + 32$	
	K =°C + 273	
	°F = (K - 273.15) * 9/5 + 32	
Mass	1 lb = 453.6 grams (g) = 7000 grains (gr.)	
	1 kg = 2.205 lb.	
Pressure	1 Atmosphere = 14.7 Pounds Per Square Inch (psi) = 101.325 Kilo Pascal (KPa)	
	psia (absolute) = psig (gauge) + 14.7	
	9.92 in Hg = 33.83 ft. H ₂ 0	
	1 kg/cm² = 14.233 psi	
	1 KPa = 0.145 psi	
Total ionized solids concentration	1 Grain Per Gallon (gr/gal) = 17.1 Parts Per Million (ppm)	
	1 Grain Per Gallon as NaCl = 0.85 Grains Per Gallon as CaCO ₃	
	1 Part Per Million (ppm) = 1 Milligram Per Liter (mg/L)	
	1 ppm as NaCl = 0.85 ppm as CaCO ₃	
	1 ppm = 1,000 Parts Per Billion (ppb) = 1,000,000 Parts Per Trillion (ppt)	
	1 ppb = 1 Microgram Per Liter (μg/L)	
	1 ppm = 1.5 μS/cm	
Resistivity/Conductivity	1 megohm-cm = 1/(μS/cm) = 1/(μmho/cm)	

Calculating Ion Exchange Capacity

Cartridge Grain Capacity / Total Dissolved Solids (Grains/Gal) = Gallons Processed Cartridge Grain Capacity x 17.1 / Total Dissolved Solids (ppm) = Gallons Processed Cartridge Grain Capacity x 64.7 / Total Dissolved Solids (ppm) = Liters Processed

glossary

Absorption – Process by which one substance is taken up by another, either chemically or physically, as when a sponge "soaks up" a liquid.

Activated Carbon – Material used to adsorb organic impurities from water.

Anion Exchange Resin – An ion exchange material that removes anions from solution by exchanging them with hydroxyl ions.

Bed – Column of carbon, sand or ion exchange resins through which the water passes during treatment.

Cation Exchange Resin – lon exchange resins capable of removing cations by exchanging them for hydrogen ions.

Conductivity – The reciprocal of resistivity, it is a measure of the ability to conduct an electric current. Since ionized impurities increase the conductivity of water, it is also an accurate measure of ionic purity. To measure it, current is passed between two electrodes a fixed distance apart. Conductivity is normally expressed as microsiemens/cm, identical to micromhos/cm.

Deionization – Removing dissolved ions from solution by passing it through a bed of ion exchange resins, consisting of polymer beads that exchange hydrogen ions for cations and hydroxyl ions for anions in solution. The ionic impurities remain bound to the resins, and the hydrogen and hydroxyl ions combine with each other to form water.

Dissolved Solids – Also referred to as Total Dissolved Solids (TDS), it is the amount of nonvolatile matter dissolved in a water sample and is usually expressed in parts-per-million by weight.

Distillation – The process of separating water from impurities by heating until it changes into vapor and then cooling the vapor to condense it into purified water.

Electrodeionization (EDI)— Removes dissolved ions from solution using electricity to ionize water and separate ions.

Effluent – The output or discharge from a water treatment

process.

Endotoxin – A poisonous substance present in bacteria that is released when the cell disintegrates. In water treatment, it most often refers to pyrogens.

Exhaustion – When absorbents, such as activated carbon or ion exchange resins, have depleted their capacity by using up all active sites. Ion exchange resins may be regenerated to reverse the process.

Feed Water – Water entering a treatment process.

Filtration – Removal of suspended matter by passing it through a porous matrix that prevents particles from getting through, usually by entrapment on or in the filter matrix.

Fouling – When gelatinous coatings, colloidal masses or dense bacterial growth form a compacted crust on membrane or filter surfaces which blocks further flow.

Grains per Gallon – Concentration of dissolved ions in water, generally as calcium carbonate. 7,000 grains is equal to a pound. One grain per gallon is equivalent to 17.1 ppm of Dissolved Solids.

Hardness – Concentration of calcium and magnesium salts in water and is sometimes also taken to include iron and manganese. High hardness can cause boiler or pipe scale and failure of reverse osmosis membranes.

Ion Exchange – Also called deionization. A process in which harmless ions attached to the resin beads are exchanged for undesirable ions in solution. Typically, hydrogen ions are exchanged for any cations and hydroxyl ions for any anions. The hydrogen and hydroxyl ions combine to form pure water.

Macroreticular Resin – An ion exchange resin with a reticular porous matrix that makes it effective for removing colloids and bacteria, as well as dissolved anions. It is especially useful for preventing colloidal and organic fouling of mixed-bed resins and premature clogging of final filters.

 $\label{eq:megohm-cm-O} \begin{tabular}{ll} Megohm-cm-\Omega A measure of ionic purity in water. \\ Resistivity (the reciprocal of conductivity) is a measure of specific resistance to electrical flow. The fewer dissolved ions in water the higher its resistivity. One megohm-cm is equivalent to one million ohms of resistance measured between two electrodes one centimeter apart. The theoretical maximum ionic purity for water is 18.2 megohm-cm at 25°C .$

Membrane – Filtration membranes are thin polymer films that are permeable to water and other fluids. Microporous membrane filters have measurable pore structures which physically remove particles or microorganisms larger than pore size. Ultrafiltration membranes (sometimes called molecular sieves), also remove molecules larger than a specified molecular weight. Reverse osmosis membranes are permeable to water molecules and very little else, rejecting even dissolved ions in water.

Mho – Unit of measurement for conductance; the reciprocal of ohm (resistance). *See Megohm-cm*.

Mixed-Bed Ion Exchange – Mixing both anion and cation resins in the same deionizer results in higher efficiency, but lower capacity than separate-bed deionizers.

NPT – Abbreviation for National Pipe Thread.

Ohm – The practical unit of electrical resistance in a circuit, where a potential difference of one volt produces a current of one ampere.

Ohm-cm – Unit of specific resistance of water.

Osmosis – The diffusion of a solvent through a semipermeable membrane from a less concentrated solution to a more concentrated solution.

Percent Recovery – In reverse osmosis or ultrafiltration, the ratio of pure water output to feed water input.

Percent Rejection – In reverse osmosis or ultrafiltration, the ratio of impurities removed to total impurities in the incoming feed water. For example, RO membranes typically remove (reject) 90% of the dissolved inorganic contaminants in water.

Permeate – In reverse osmosis, the water that diffuses through the membrane, thereby becoming purified water.

Pretreatment – Initial water treatment steps performed prior to final processing to prolong the life of cartridges and filters and to protect downstream elements from premature failure.

Product Water – The purified water produced as a result of treatment.

Pyrogens – Lipopolysaccharides found in the outer cell walls of certain bacteria which can trigger an immune response.

Recirculation – Continuous recirculation may be necessary to maintain uniformly high purity in larger water systems. Water is continuously recirculated and reprocessed to prevent stagnation and to rinse out residual impurities in the system. Bacteria flourish in stagnant water.

Reject – In reverse osmosis and ultrafiltration, those impurities not able to permeate the membrane are said to be rejected (removed). They are flushed away in the reject (waste) stream.

Resin – Ion exchange resins are usually bead-like spherical materials with an affinity for particular ions. Cation exchange resins, made of styrene and divinylbenzene containing sulfonic acid groups, will exchange hydrogen ions for any cations they encounter. Similarly, anion exchange resins, made of styrene and divinylbenzene containing quaternary ammonium groups, will exchange a hydroxyl ion for any anions.

Resistivity – A measure of specific resistance to the flow of electricity. In water, it is an accurate measure of ionic purity. *See Megohm-cm*.

Reverse Osmosis – The reversal of osmosis to purify water. In osmosis, water diffuses through a semipermeable membrane from a less concentrated solution to a more concentrated solution. The flow of water can be reversed with an opposing pressure that exceeds osmotic pressure. With Reverse Osmosis, water is forced out of a concentrated solution, leaving the solute (impurities) behind.

glossary

Salt Rejection – In reverse osmosis, the ratio of salts removed (rejected) to the original salt concentration. *See Percent Rejection*.

Scale – The mineral deposits that can coat the insides of boilers or the surfaces of RO membranes. It consists mainly of calcium carbonate, which precipitates out of solution under certain conditions of pH, alkalinity and hardness.

Semipermeable – Membranes that do not have measurable pores, but through which smaller molecules can pass.

Suspended Solids – Undissolved solids that can be removed by filtration.

TDS – Abbreviation for total dissolved solids.

Total Ionized Solids – Concentration of dissolved ions in solution, expressed in concentration units of NaCl (sodium chloride).

Total Organic Carbon (TOC) – A measure of the level of organic impurities in water, which determines the operating life of activated carbon beds.

Total Solids – Total solids in water include both dissolved and suspended solids.

Turbidity – A suspension of fine particles that obscures light rays but requires many days for sedimentation because of small particle size.

Two-Bed – Separate beds or layers of cation and anion exchange resins. Results in lower purity than mixed-bed deionization, but provides higher capacity in terms of throughput.

Ultrafiltration – Molecular sieves; membranes with pores small enough to remove large molecules. Rated in terms of nominal molecular weight cutoff. A 10,000 Dalton (molecular weight) UF membrane, for example, will remove bacterial pyrogens, which are typically in the range of 20,000 Daltons.

Ultrapure Water – Water with a specific resistance higher than 1 megohm-cm. In the laboratory, it usually refers to ASTM D1193 Type 1 reagent grade water. Anything in laboratory water that is not $\rm H_2O$ is an impurity. Although chemically pure water is not attainable, ultrapure water systems are now capable of reducing impurities down to the limits of detection.

UV Oxidation – Ultraviolet radiation is employed in water purification for the photochemical oxidation of organic impurities, resulting in HPLC grade water with organic impurity levels below 5 ppb.
